

Microsoft Azure Cognitive Services: Translator Text API

UNDERSTANDING THE BASICS OF TEXT TRANSLATOR

William C. Myers

SENIOR FASTTRACK ENGINEER - AZURE CXP

Overview

Scenario

Translator Text API Capabilities

- Supported languages
- Translation
- Transliteration
- Language identification
- Word translation
- Sentence length

Scenario Details

Patient communication

Realtime translation

Translator Text Is a REST API

Uses the REST verbs POST and GET

Requires body to be in JSON format

API key passed in the header to authorize

```
[-] ar
  ... dir = rtl
  ... name = Arabic
  ... nativeName = العربية
  [-] translations
    [-] {}
      ... code = en
      ... dir = ltr
      ... name = English
      ... nativeName = English
[-] bg
  ... dir = ltr
  ... name = Bulgarian
  ... nativeName = Български
  [-] translations
    [-] {}
      ... code = en
      ... dir = ltr
      ... name = English
      ... nativeName = English
[-] bn
  ... dir = ltr
  ... name = Bangla
  ... nativeName = বাংলা
```

Nested JSON showing source language and available translations

Text Translation

Requires the from and to languages passed as query parameters

Can translate multiple items

Text Transliteration

From Dictionary.com:

transliterate[trans-lit-uh-reyt, tranz-]

to change (letters, words, etc.) into corresponding characters of another alphabet or language:

Example: الله which translates from Arabic as God, but would be transliterated in english as Allah.

Language Identification

Attempts to determine the source language as well as possible alternatives

Word Translation

Translates a single word and provides usage examples of alternate translations

Sentence Length

Breaks apart the string by sentence

Returns an array of numbers indicating the length of the sentences passed in.

Demo

1. Setting up Translator Text in the Azure portal and calling it via Postman and Fiddler
2. Calling the API with C# in a console app

Summary

REST API

Language agnostic

Translator Text API features
