

# Microsoft Azure Developer: Connecting to Storage

---

IDENTIFY CONNECTION REQUIREMENT INFORMATION

**Warner Chaves**

MS DATA PLATFORM MVP

@warchav sqlturbo.com

# What's in this module?

**Course Overview**

**Basic Network Security**

**Resource Names**

**Authentication and Authorization**

# Course Overview

# Connecting to a Resource

# Network Security

---

# Connection Types

**Public Endpoint  
– Internet  
Facing**

**Service  
Endpoint –  
Virtual Network  
(VNET) Facing**

**Internal VNET  
Endpoint –  
Resource is inside  
the VNET**

# Public Endpoint

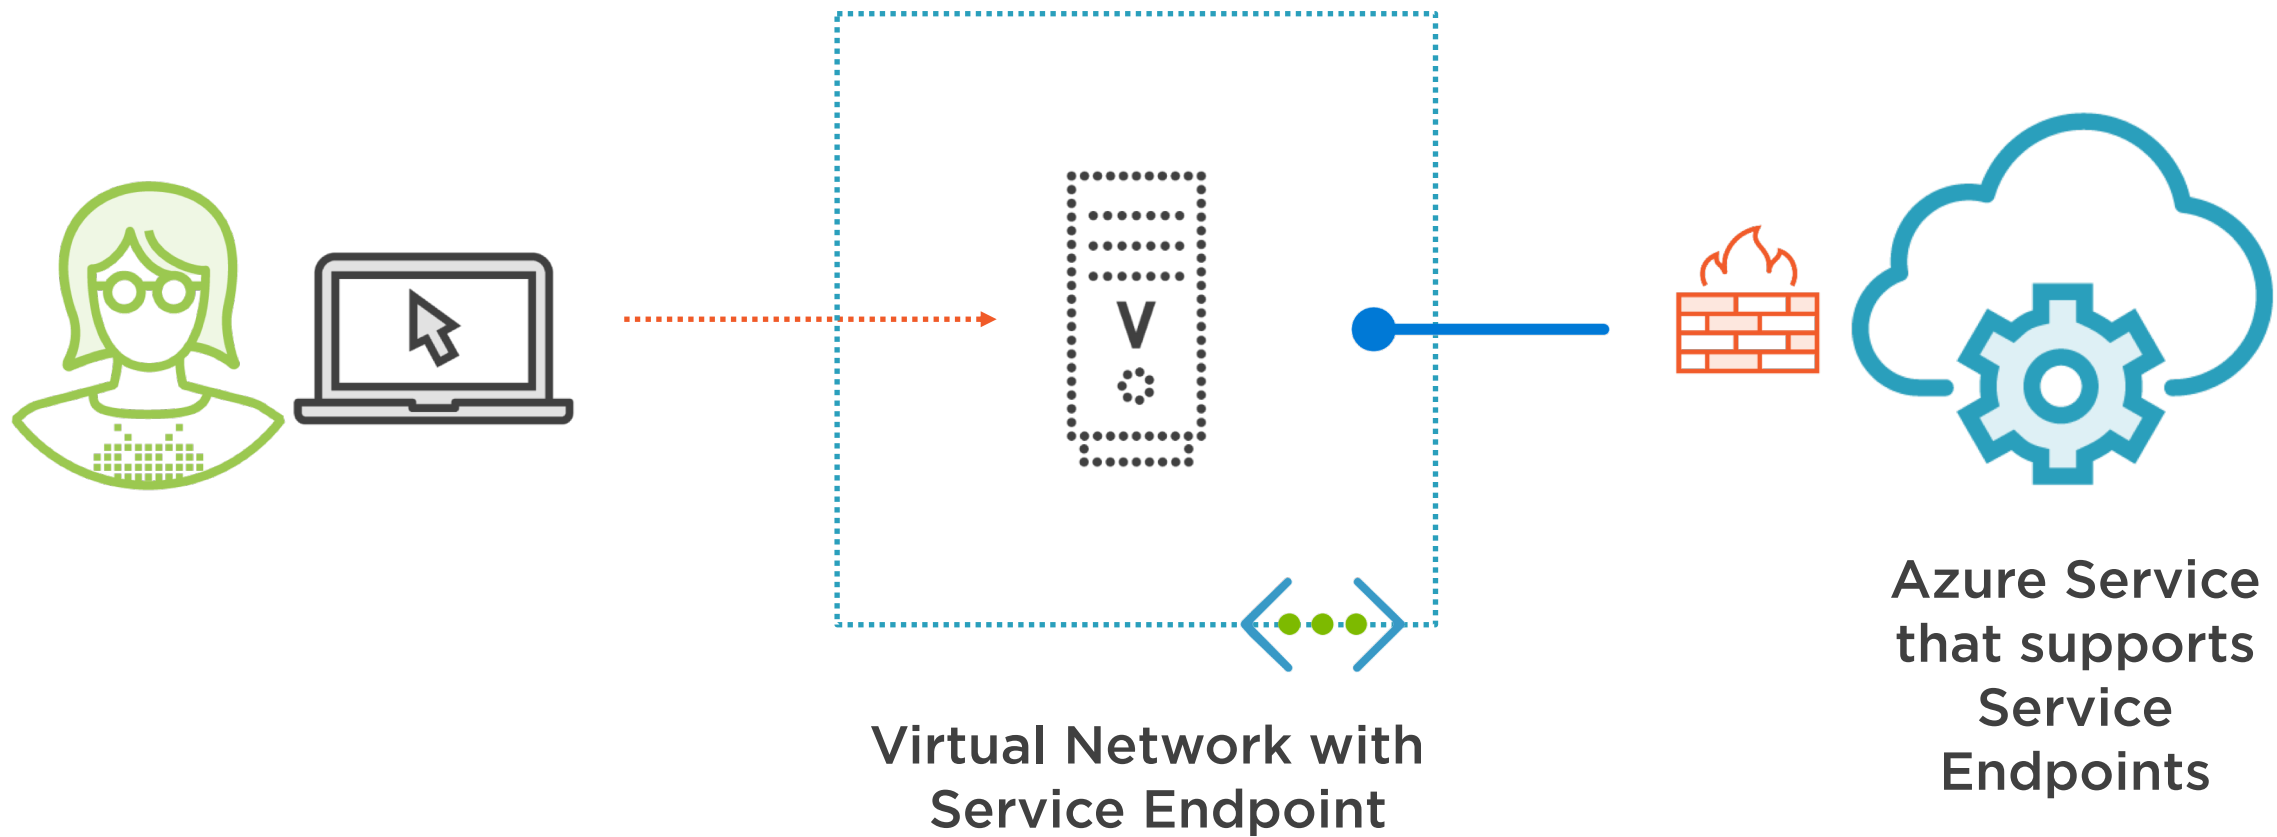

Proper Firewall settings are critical for Public  
Endpoint services.

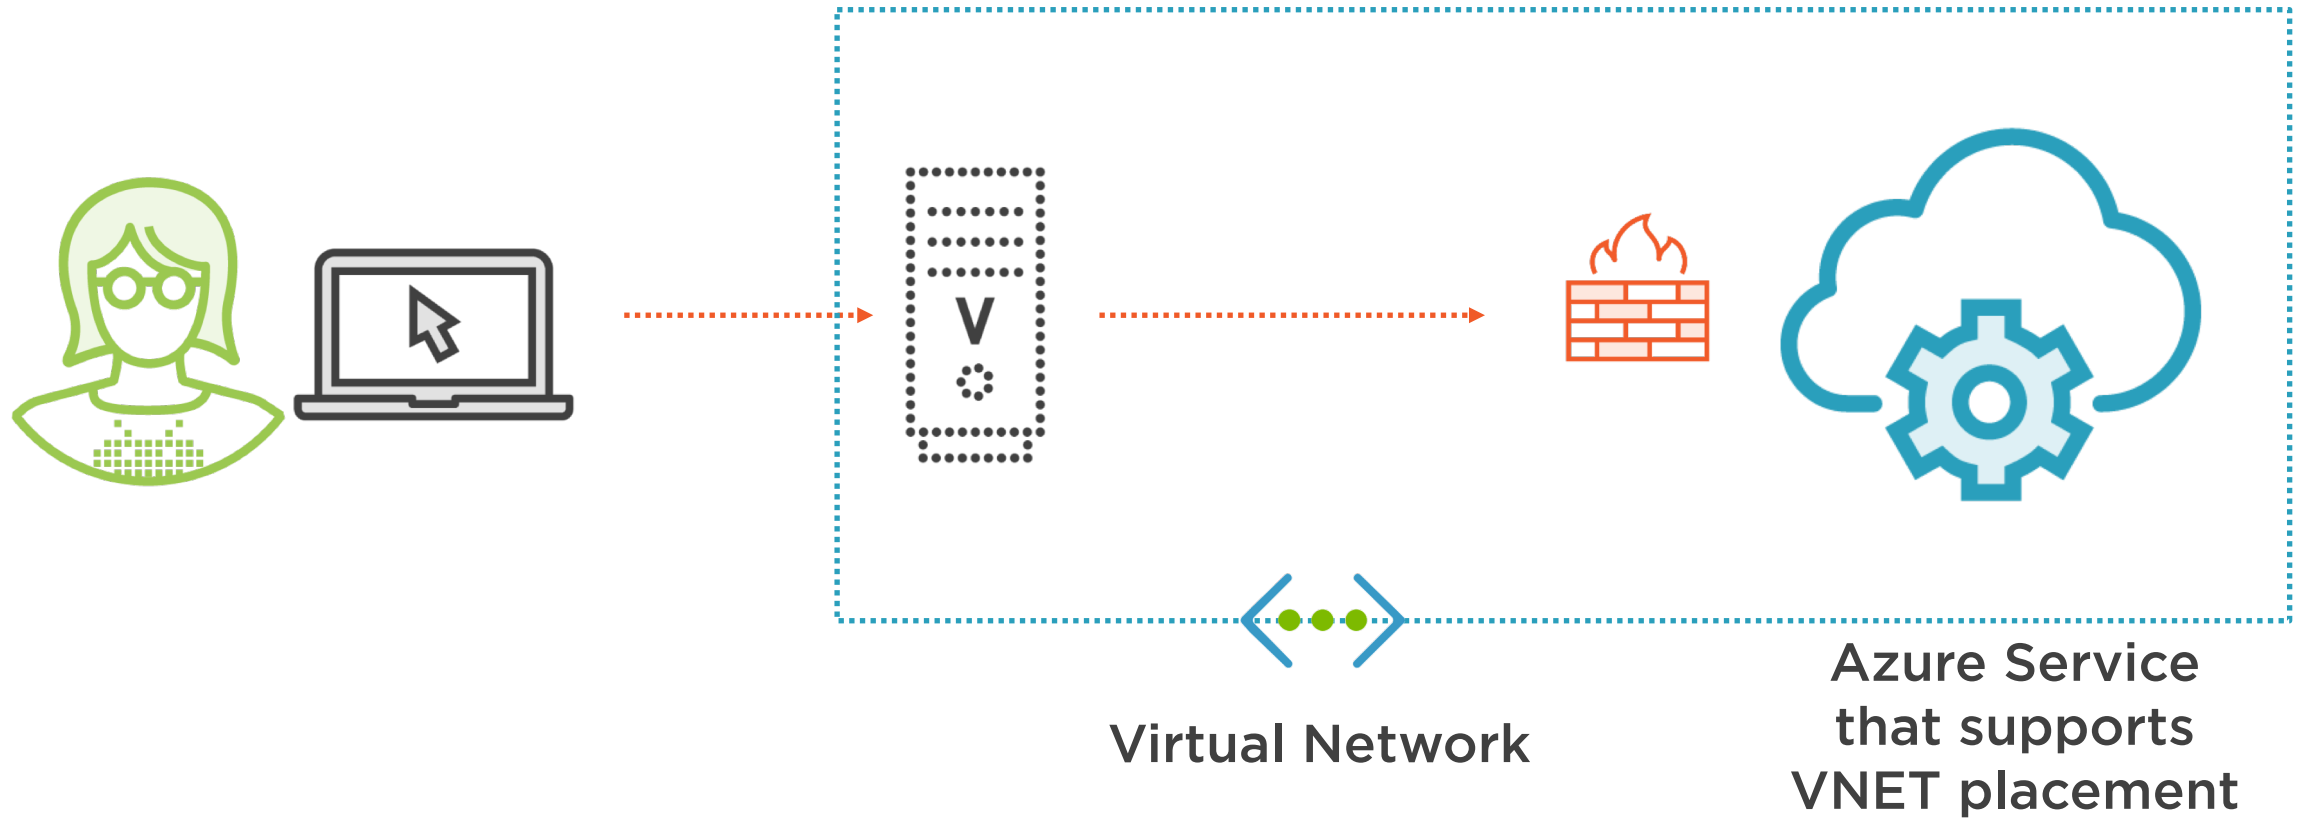

# Service Endpoint

# Resource Inside the VNET

# Troubleshooting Network

**Verify if your service has a Public, Service or VNET endpoint**

**Verify that your client machine is added to any firewall or network security rules**

**If it's Service or VNET Endpoint, verify that the client is part of the allowed VNET**

**If it's Service Endpoint, verify that the VNET is allowed on the service**

**Verify no local firewall is blocking your access**

# Resource Names

---

# Connecting to a Resource

# Different Service Names

[https://\\*\\*\\*\\*\\*.core.  
windows.net/](https://*****.core.windows.net/)

TCP:  
\*\*\*\*\*.database.windows  
.net, port 1433

TCP:  
\*\*\*\*\*.redis.cache.windows  
.net, port 6380

# Troubleshooting Names

**Verify you have the correct  
resource name, including case  
sensitivity**

**Verify you have the correct  
port and protocol**

# Authentication and Authorization

---

# Connecting to a Resource

# Authentication

**You validate your identity to the service  
using a set of credentials**

# Examples

**Azure Active Directory account**

**SQL database username and  
password combination**

# Authorization

After being authenticated, the service allows you to perform a specific set of actions based on your identity

# Keys and Tokens

**Keys and Tokens merge authentication and authorization in one credential**

# Troubleshooting Authentication and Authorization

**Verify you have  
the correct type  
of credential**

**Verify you have  
valid credentials**

**Verify you have  
been given proper  
permissions**

# Putting Everything Together

It has a public endpoint and our client is on the Firewall

We have the SQL host name

We have an Azure AD account and it has permission to connect

# Demo

Gathering information and connecting to  
Azure SQL Database

# Keeping up to Date

In the cloud, service details can change.  
Refer to [azure.com](https://azure.com) for the latest information.

# Summary

The course will cover connections to Azure Storage, SQL Database, and Redis.

There are 4 pieces necessary to connect:

- Network connectivity
- The resource name
- A way to authenticate
- Authorization to interact with the resource

Put it all together to connect to an Azure SQL Database

Next Module:  
Connect to Azure Storage
