

Connecting to Azure Databases

Warner Chaves

MS DATA PLATFORM MVP

@warchav sqlturbo.com

What's in this module?

Azure Storage Services

Network Security Options

Authentication and Authorization

Available Permissions

Azure SQL Databases

A cloud-first family of relational database services based on the SQL Server engine

Offerings

Azure SQL Database (single database and elastic pools)

Azure SQL Managed Instance

Service Name

Protocol: TCP

Port: 1433

Server name: *****.database.windows.net

Database name

Network Security Options

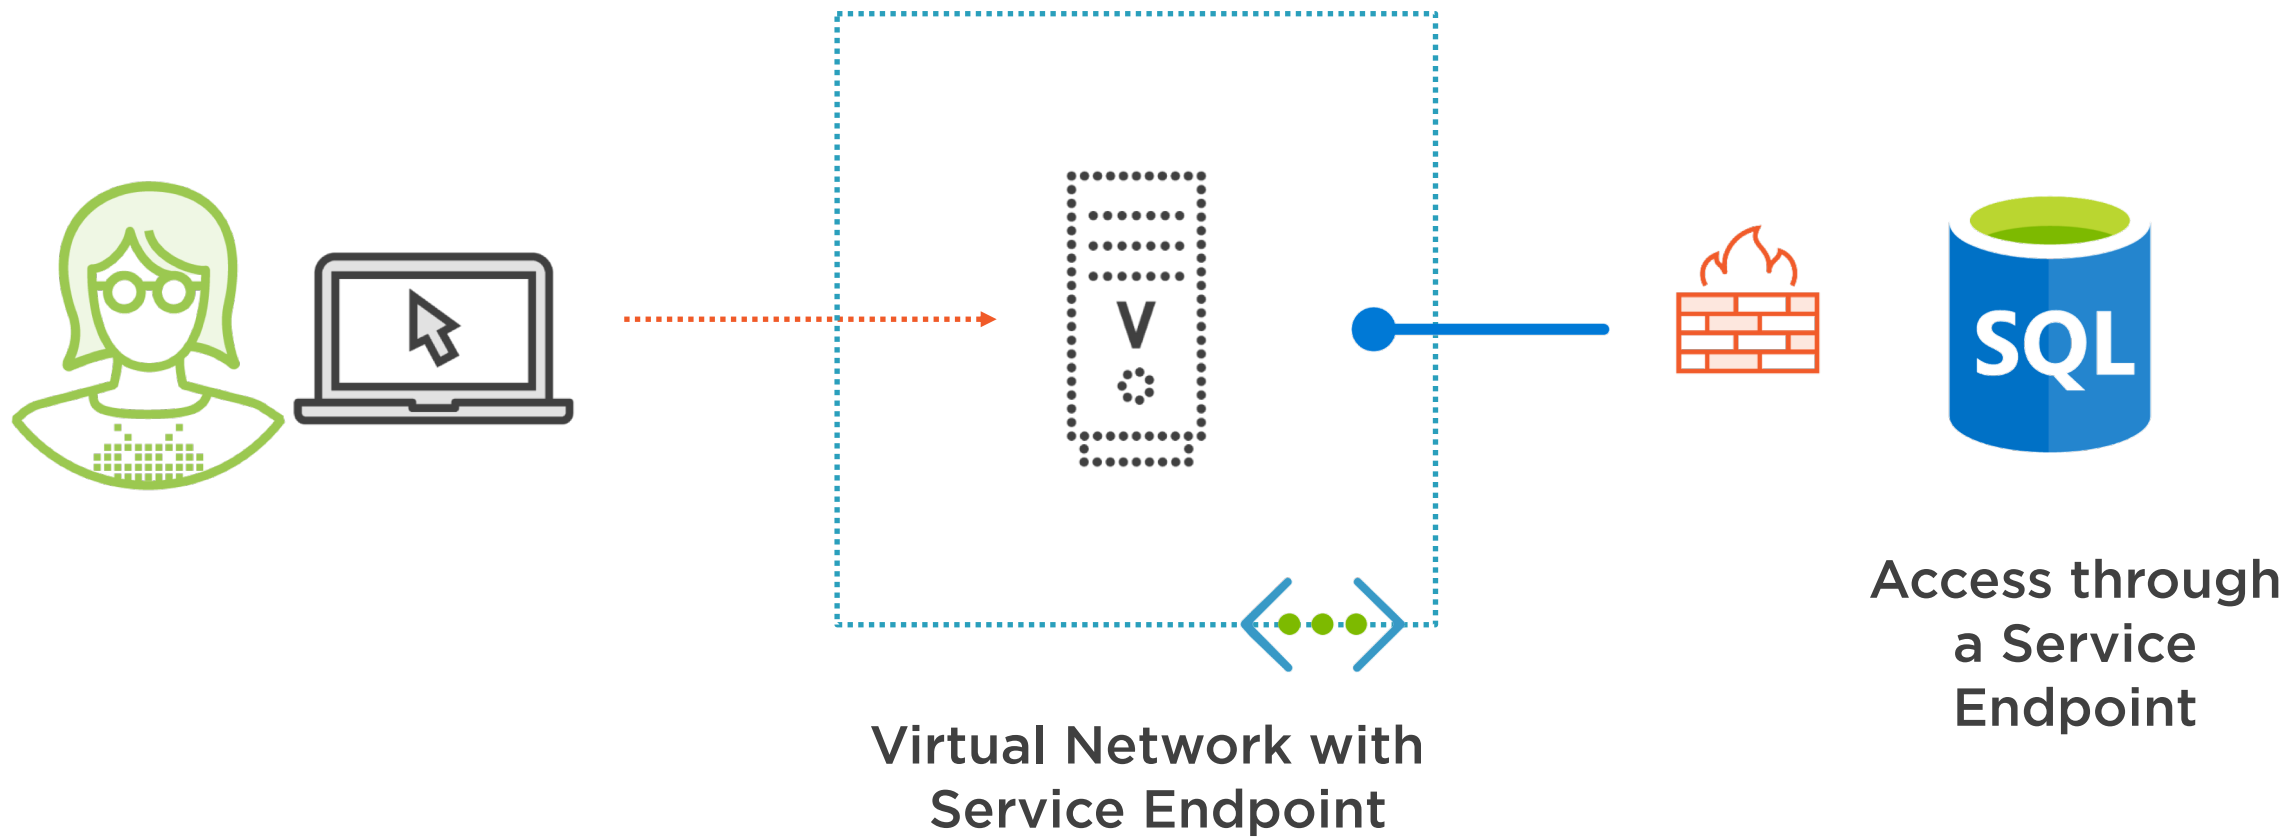

Public Endpoint

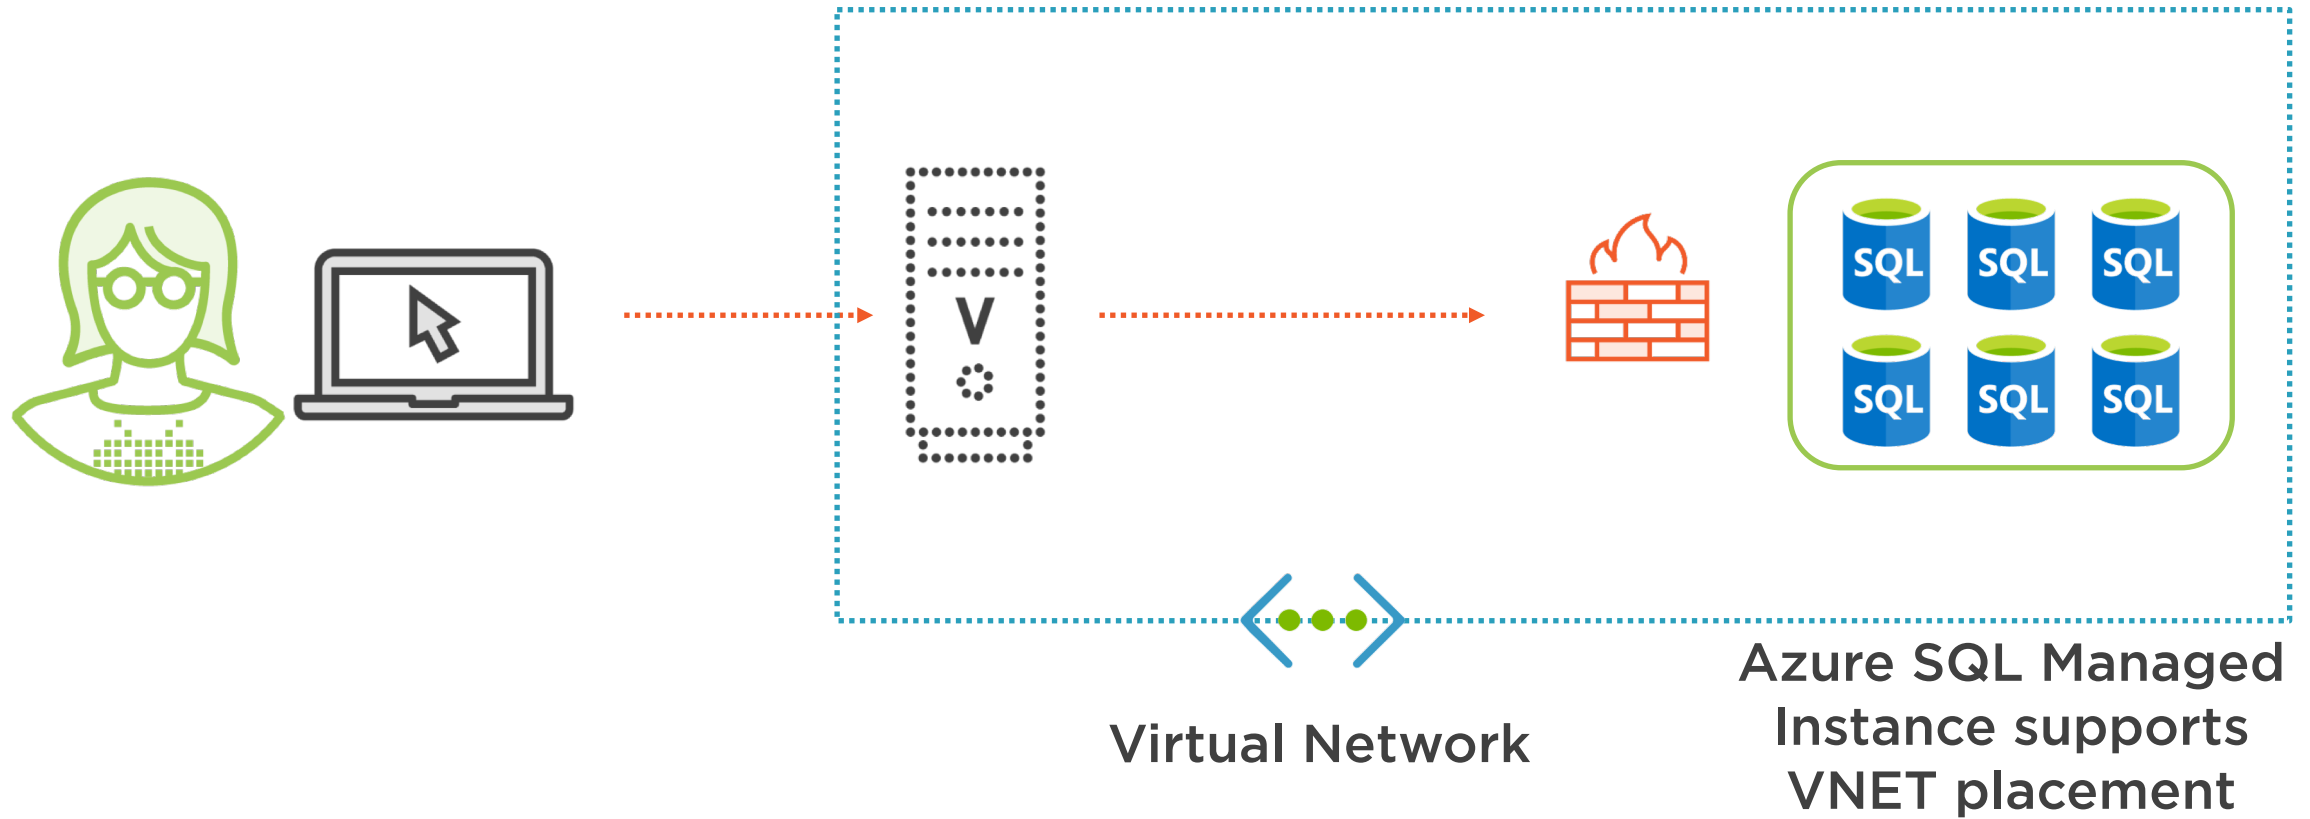

Internet facing endpoint

Service Endpoint

Resource Inside the VNET

Proper firewall configuration is critical, especially for
public endpoint databases

Authentication and Authorization

Authorizing Access

**Azure Active
Directory (AAD)**

SQL Authentication

Role-based access control

Users, Groups or Applications

High security with ease of use

Role-based access control

Users, Groups or Applications

Lower security

Legacy

Azure AD Advantages

**Reuse identities
across servers**

**Password rotation
in one place**

**Easier to manage
at scale**

**Can be
synchronized with
Windows AD**

Supports MFA

Azure AD should be used over SQL Authentication
whenever possible

SQL Database closes connections that remain idle for more than 30 minutes

Available Permissions

Fine-grained Access

Azure Active Directory (AAD)

SQL Authentication

Scope

Permissions

CONNECT

**Server
Roles**

Database Roles

Object

Column

Row

SQL Database Built-in Server Roles

Administrator

Login Manager

Database Creator

Database Roles and Permissions

Database Reader

Database Writer

SELECT - INSERT - UPDATE - DELETE

Execution Permissions

Column and Row Permissions

And more...

Putting Everything Together

It has a public endpoint and our client is on the Firewall

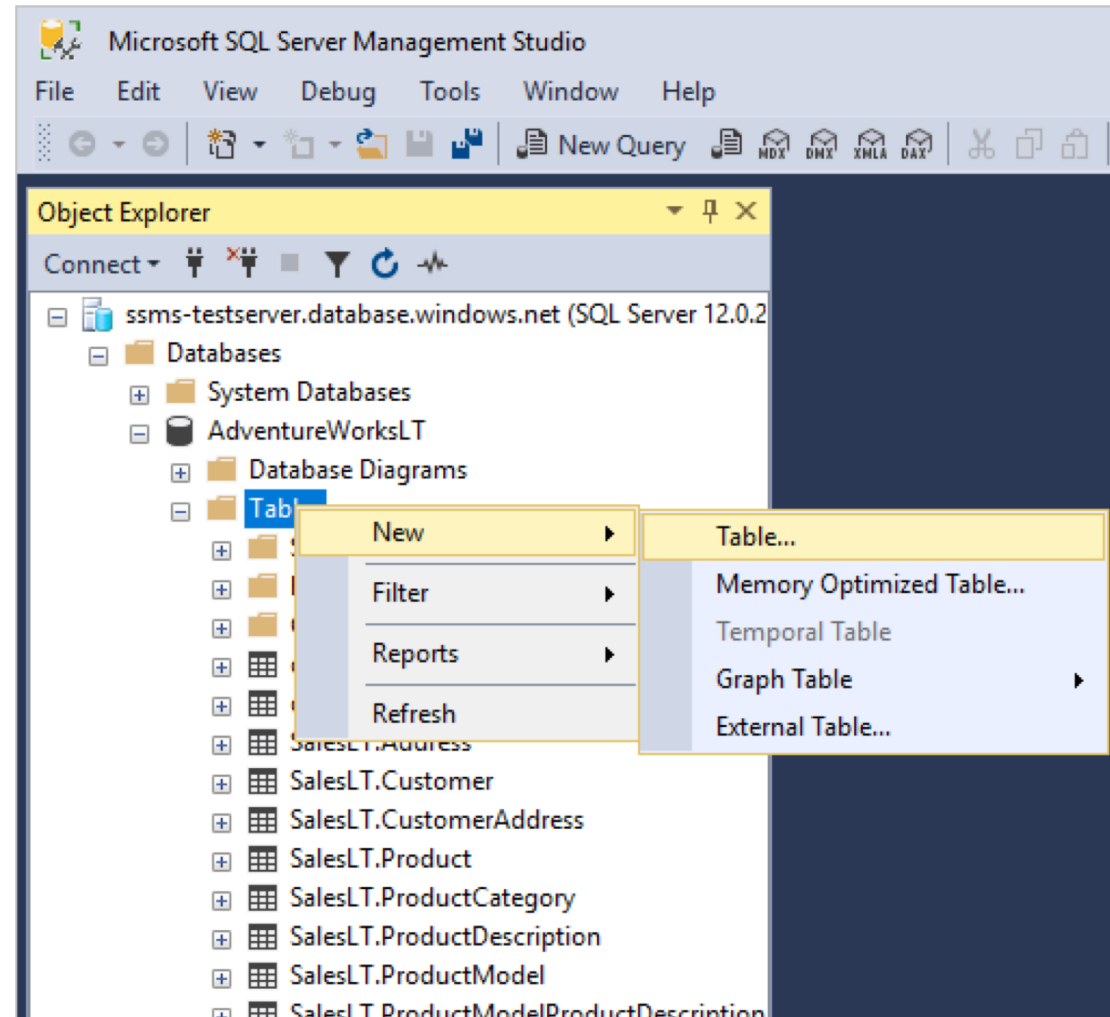

We have the server and database name

We have an AAD account

We want to connect with SQL Server Management Studio

SQL Server Management Studio (SSMS)

Demo

Connecting SSMS to Azure SQL Database
using Azure Active Directory

Summary

The services include public, VNET service endpoints and VNET placement

Authentication and authorization can be done through AAD or SQL

Authentication

Lots of options in terms of controlling permissions

Put it all together to connect SSMS to Azure SQL Database

Next Module:
Connect to Redis Cache
